AngularJS or Angular How to choose for your business?

When stability is the issue when it comes to framework choice.

Angular is a complete rewrite from AngularJS but that is not to say AngularJS is bad or inferior than Angular 2, 3,4,5,6,7,8 or just Angular. This talk is about AngularJS writen in JavaScript and not addressing anything on Angular since there is nothing newer on AngularJS since Angular is a rewrite it's wrong to say Angular is newer than AngularJS. We not going to talk about a framework religion here but the business side of choosing AngularJS over Angular one reason right out of the box should be trust and contract for support.

Making a choice to build website using Angular

We refer to framework as concepts applied to achieve a particular goal in business a framework is a unit of concepts applied, that when used well they lead to less problems and higher rate of success, simply a way of doing things the angular way of building websites is backed by research and the large corporation behind angular which is google. The success of angular relies on how comfortable the engineers working on your AngularJS application as far as concepts, strategies for delivering real business value to customers. JavaScript can build applications without framework but lots of problems with starting and building a strong foundation for your application will take sometime to effectively understand and keep track of one way of doing things. Feel free to ask about angular decisions when choosing the framework by emailing goodwish@axxess.co.za

Developers learn about your business

As a developer using JavaScript angular enforces strong rules and more structured application flow seperating business logic in the whole application trust me this is not going to be another JavaScript topic on why you should use angular for your business but why it is used instead to address common problems in order for you to buy in the framework popularity is why you want to use angular on your next project or existing is simply because you want to keep your business online presence a better one for your customers, Angular does not help build traditional websites it builds powerful desktop like applications where users are able to feel content move, shape itself with some kind of behaivour to touch, swipe, click events happening on the page. As the user or customer visits your website your website is more geared towards business value rather than it becoming another sophisticated technical difficulty online. For a smooth transformation of your wordpress website to angular website contact goodwish@axxess.co.za

What, I don't think i need Angular for my business website

Yes, you might not need angular for your company website if what you want for your customers is just static pages, but if you need a dynamic website with features such as enabling your business to facilitate the following:

1. Customer Login/Registrations

2. Dashboards for your customers to track support tickets, orders etc..

3. Enable customers to manage subscriptions, meetings etc..

4. Provide booking of any kind for travel, seminars, appointments for doctors etc...

5. Provide live quotations, banking services like abc bank, etc...

6. Provide state of the art customer CRM solutions, recruitment portals etc...

   for a complete list of what is possible with angular feel free to get intouch
